Sequence of switching off the power switch in the home s electrical distribution box

Overview

How to Turn Off the Power to Your House Learn how to turn off the power to branch circuits or to the entire home at the main circuit breaker panel or fuse.

Key Takeaways

To safely turn off your home's power, locate the main circuit breaker in your electrical panel and switch it to the OFF position, following proper safety precautions.

Step-by-

Step Instructions1. Locate the Electrical Panel: Your home's electrical panel, also called a breaker box or service panel, is usually a gray or off-white metal cabinet. Common locations include the basement, garage, utility room, hallway closet, or sometimes on an exterior wall.

Familiarize yourself with its location before you need it. 2. Open the Panel Door: Carefully open the panel to access the breakers.

Ensure the area around the panel is dry and wear rubber-soled shoes for insulation. 3. Identify the Main Breaker: The main breaker is the largest switch in the panel, often labeled “Main” or colored differently (sometimes red).

It is usually located at the top or side of the panel and controls all electricity in the house. 4. Turn Off Individual Branch Circuits (Optional but Recommended): For added safety and to reduce arcing, flip all smaller branch circuit breakers to the OFF position before turning off the main breaker.

This step is especially important if you are performing major electrical work. 5. Flip the Main Breaker: Firmly push the main breaker switch to the OFF position.

This shuts off power to the entire house. You should hear a click as the breaker disengages. 6.

Confirm Power is Off: Use a non-contact voltage tester at outlets, switches, or light fixtures to ensure electricity is completely off before starting any work. Never assume the power is off without testing.

Safety Precautions

Never touch exposed wires inside the panel; assume all wires are live until confirmed otherwise. Avoid water near the panel; moisture increases the risk of electrical shock. Do not force breakers that feel stuck; this could indicate a problem requiring a licensed electrician.

Have a flashlight ready in case the power goes out unexpectedly. Call a professional if the panel shows signs of damage, burning, or corrosion.

Special Considerations

Older homes with fuse boxes: Pull the main disconnect or remove the main fuse block to cut power. Individual circuits can be turned off by unscrewing fuses counterclockwise. Sub-panels: Some homes have sub-panels with their own main breaker, which only controls a subset of circuits.

Turning off the sub-panel does not cut power to the entire house. Following these steps ensures that you can safely turn off your home's electrical power for repairs, maintenance, or emergencies while minimizing the risk of injury or electrical hazards.
