Cable management at the rear of the power distribution frame

Overview

Power cord retainers are typically found at the rear of the unit and on the chassis or pedestal near the alternating current (AC) power cord input. Systems that are rack-mounted and are on rails must use the provided cable management arm. Network cable management is essential in data centers to keep wiring organized and improve heat dissipation, reduce maintenance efforts, and prevent signal issues caused by cable tangling or bending. The primary purpose of power cord retention is to prevent unexpected power loss to your system that can potentially cause system operations to stop functioning. Different types of power cord. Complete server/networking solutions with patented, easy-to-install cabling infrastructure.
