Connecting the network port to relay protection

Overview

IEC 61850 configuration instructions Easergy P3 Application BookBefore configuring the redundancy protocol, define the Ethernet port settings as described.

Key Takeaways

Network ports on protection relays are connected to secure networks to enable communication, monitoring, and control, following IEC 61850 or IEC 60870-5-103 standards.

Overview

Connecting a network port to a protective relay allows the relay to communicate with other devices, SCADA systems, or relay-to-relay schemes for fault detection, control, and monitoring. This connection is essential for modern protection systems, enabling high-speed line protection, remote tripping, and data exchange between relays and control centers.

Steps for Network Connection

Secure Network Setup

Ensure the network is secure, using firewalls, authentication, encryption, and antivirus measures to prevent unauthorized access or data breaches. Only qualified personnel should handle network administration and relay configuration.

Physical Connection

Use the relay's Ethernet or serial port to connect to the network. For Ethernet/IP relays (e.g., ABB 857 or Rockwell 857), connect the relay to a switch or directly to the control system using standard Ethernet cables. Ensure proper grounding and avoid potential differences that could damage the relay.

Protocol Configuration

Configure the relay to communicate using the appropriate protocol: IEC 61850 for substation automation and relay-to-relay communication.

IE

C 60870-5-103 for SCADA integration and legacy systems. Use engineering tools like PCM600 or Studio 5000 to configure input/output assemblies, logical nodes, and tag mapping.

Relay-to-

Relay Communication

For high-speed line protection, relays can exchange logic status, trip signals, and fault direction information directly over the network. This allows permissive tripping and faster fault isolation without relying on slower external communication equipment.

Testing and Commissioning

Verify network connectivity, data integrity, and relay response times. Test trip commands, alarms, and monitoring functions to ensure proper operation under fault conditions. Document the configuration and maintain a secure backup of relay settings.

Best Practices

Always follow manufacturer guidelines and local electrical safety regulations. Use dedicated network segments for protection relays to minimize interference. Regularly update firmware and security settings to maintain reliability.

Label and document all network connections and relay ports for maintenance and troubleshooting. By following these steps, a network port can be safely and effectively connected to a protection relay, enabling secure communication, fast fault detection, and reliable system operation.

IEC 61850 configuration instructions Easergy P3 Application Book

Before configuring the redundancy protocol, define the Ethernet port settings as described in Configuring IEC 61850 communication for a single Ethernet connection.

PowerPoint Presentation

The 615 series Technical Manual and Communication Protocol Manuals offer more detailed information regarding the relays'' communication ports and communication options

IEC 61850 Engineering Guide 611 series RELION® PROTECTION

This manual IEC 61850 engineering of the protection relays with PCM600 and IET600. The guide can be used as a technical reference during the engineering hase, installation and commissioning phase,

Feeder Protection Relay Operation Manual

The message can indicate the starting or tripping of protection functions or an internal fault in the device. Press to close the indication message without clearing it or press to activate the Clear view and to

WebRelay Users Manual

Installation consists of mounting the WebRelay, connecting it to an Ethernet network, providing power, and connecting the relay contacts to the device that will be controlled.

Easergy Pro 3.0.1 not connecting to Easergy P5 after Windows 10

I was able to communicate to two Easergy P5 through USB but after Windows update I could not connect to these relays Via USB port anymore. Connection to relay with Ethernet port is OK

ABB REF615 [16/40] Relay communication interfaces

in relay configuration. Front port is used for engineering and it can be used only for point-to-point configuration access with PCM600 or WHMI. Front port should not be connected to any Ethernet

Modbus POE ETH Relay

No need to download additional drivers for the device; after establishing a TCP connection, you can directly send Modbus commands to control the device relay''s on/off actions or query the relay status.
