Does laying fiber optic cables require bending

Overview

All fiber optic cables have specifications that must not be exceeded during installation to prevent irreparable damage to the cable. This includes pulling tension, minimum bend radius and crush loads.

Key Takeaways

Yes, fiber optic cables can bend, but there are important considerations: They can withstand some bending during installation, which is useful for positioning them. Each fiber optic cable has a minimum bend radius specification that must not be exceeded to prevent damage or significant signal loss. Excessive bending can lead to light signals leaking out of the fiber, increasing insertion loss and degrading performance.

It's crucial to follow the manufacturer's guidelines to ensure the integrity of the cable.
