GPON s passive devices

Overview

The OLT is an aggregation device that terminates PON protocol packets at the central office (CO). It distributes downstream data and centralizes upstream data, and is highly reliable. This document describes the Gigabit Passive Optical Network (GPON) technology and how it functions. There are no specific requirements for this document. A PON network consists exclusively of passive optical components. It is commonly used to implement the link to the customer (the last kilometre, or last mile) of fiber-to-the-premises (FTTP) services, using a. A passive optical network (PON) or Gigabit Passive Optical Network (GPON) is a point-to-multipoint (P2MP) network that uses a combination of active transmission equipments and passive cable components to provide network connectivity to end user's devices.

A passive optical network (PON) is a fiber-optic telecommunications network that uses only unpowered devices to carry signals, as opposed to electronic equipment. In practice, PONs are typically used for the last mile between Internet service providers (ISP) and their customers. In this use, a PON has a point-to-multipoint topology in which an ISP uses a single device to serve many end-user sites using a system suc
