How big is a Class III explosion-proof distribution box

Overview

·Equipped with specialized hinge structure, which can prevent the flameproof joints from damage when opening and closing the box, and greatly prolong the service life of box.

Key Takeaways

Class III explosion-proof distribution boxes vary in size, typically ranging from compact wall-mounted units to larger modular enclosures, with dimensions often customized to fit specific installation and circuit requirements.

General Size and Configuration

Class II

I explosion-proof distribution boxes are designed for dust-hazardous environments and are built to contain sparks or flames safely. Their size depends on the number of circuits, internal components, and installation type: Compact wall-mounted units: Often used for small control circuits or terminal connections, these can measure approximately 300–600 mm in height, 200–400 mm in width, and 150–300 mm in depth. Medium to large modular units: Designed for multiple circuits, motor starters, or complex control systems, these can exceed 1000 mm in height and 600 mm in width, with depth varying from 300–500 mm.

Customizable modular designs: Many Class III boxes, such as the BX53-III series, allow combining multiple enclosures to save space and meet specific distribution needs, meaning overall dimensions can be tailored to the installation site.

Material and Construction Impact

The enclosure material affects both durability and size: Stainless steel (304 or 316L): Provides corrosion resistance and mechanical strength, often used in larger or outdoor installations.

Aluminum or GR

P: Lightweight options suitable for smaller units or less corrosive environments.

Installation Considerations

Vertical or wall-mounted installation: Brackets and mounting hardware are included, and the box may require additional clearance for hinged doors and cable entry. Internal space: It is recommended to leave at least 20% extra space inside for wire bending, maintenance, and future expansion.

Certification and Standards

Class II

I boxes are certified for dust environments (IIIC) and comply with standards such as ATEX, IECEx, and NEMA, which may influence enclosure thickness and overall size to meet flameproof requirements. In summary, Class III explosion-proof distribution boxes are highly variable in size, ranging from small wall-mounted units to large modular enclosures, with dimensions tailored to the number of circuits, internal components, and installation requirements. Always consult the manufacturer's datasheet for exact measurements for a specific model.
