How to connect two fiber optic cables to one wire

Overview

Need to extend, repair or join two fibre optic cables? There are three main methods, each with its own advantages and limitations.

Key Takeaways

Two fiber optic cables can be connected to a single line using fusion splicing, mechanical splicing, or a fiber optic coupler, depending on whether a permanent or temporary connection is needed. Methods for Connecting Fiber Optic Cables1. Fusion Splicing Fusion splicing is the most reliable and permanent method.

It involves aligning the bare ends of two fibers under a microscope and fusing them with an electric arc. This creates a continuous optical path with minimal signal loss, typically 0. 02–0.

05 dB. Fusion splicing is ideal for long-distance or high-performance networks, such as FTTH installations or backbone connections. Tools required include a fusion splicer, fiber cleaver, stripper, cleaning supplies, and protective sleeves to secure the splice.

2. Mechanical Splicing Mechanical splicing aligns the fiber ends inside a small housing filled with index-matching gel. It does not require electricity and is faster than fusion splicing, but it introduces slightly higher signal loss (0.

2–0. 75 dB). Mechanical splices are suitable for temporary connections, field repairs, or situations where a fusion splicer is unavailable.

3. Fiber Optic Couplers (Splitters/Adapters) A coupler or splitter allows two fibers to connect to a single fiber line without splicing. The coupler aligns the fiber cores using a zirconia sleeve or similar mechanism.

This method is simple, does not require specialized tools, and is ideal for patch panels or situations where cables need to be connected and disconnected frequently. Hybrid couplers can also connect different connector types, such as SC/APC to LC/UPC, but APC and UPC connectors should not be mixed on the same type.

Key Considerations

Signal Loss: Every connection adds some loss. Fusion splicing offers the lowest loss, followed by mechanical splicing, and then couplers. Fiber Type: Ensure single-mode fibers are connected to single-mode, and multi-mode to multi-mode, to avoid performance issues.

Connector Compatibility: Match connector types (LC, SC, ST, FC) or use hybrid adapters if necessary. Preparation: Clean and inspect fiber ends before connecting to prevent dust or oils from degrading signal quality. Safety: Wear gloves and safety glasses to protect against glass shards from fiber cables.

By choosing the appropriate method based on permanence, performance requirements, and available tools, you can successfully connect two fiber optic cables to a single line while maintaining optimal signal integrity.
