How to determine how many cable management racks you need

Overview

Network Rack Cable Management: 2026 Standards2026 Guide to Network Rack Cable Management. Includes Rack Unit Calculator, PoE++ thermal planning, Grounding.

Key Takeaways

The number of cable management racks required depends on the number of patch panels, switches, and the overall rack layout, typically using one horizontal manager per patch panel and vertical managers along the sides of the rack. Key Considerations1. Horizontal Cable Managers: Horizontal cable managers are installed between patch panels and switches to guide and support cables.

For example, in a setup with 240 connections using 24-port patch panels, you would typically need one horizontal cable manager per patch panel, often 1U or 2U in height, resulting in approximately 11 horizontal managers for 10 patch panels in a 42U rack. Horizontal managers also help maintain proper bend radius and reduce cable stress. 2.

Vertical Cable Managers: Vertical managers run along the sides of the rack and provide dedicated channels for high-density cabling. They are essential for separating copper and fiber cables and maintaining airflow. Most racks benefit from vertical managers on both sides, especially in high-density environments.

Overhead or Front-to-

Back Management: For cables running between multiple racks or from front to rear, overhead horizontal cable management units or cable trays are recommended. These allow cables to transit cleanly across racks without tangling or obstructing airflow. 4.

Planning for Future Expansion: It is recommended to leave extra U-space (around 30%) for future devices and additional cable management. Avoid overfilling channels and ensure proper labeling for easier maintenance. 5.

Cable Type and Fill Capacity: The number of managers also depends on cable type (Cat6A, fiber, PoE++ loads) and fill percentage. High-power PoE++ switches generate heat and require careful routing to avoid tight bundling.

Practical Example

Rack with 10 patch panels (24 ports each): 11 horizontal managers (2U each)Access switches in a separate rack: Horizontal managers between each switch (2U recommended)Core switches and routers in another rack: Horizontal managers between devicesVertical managers: One on each side of each rackOverhead trays: For inter-rack connections and front-to-back routing By following this approach, you ensure organized cabling, proper airflow, and room for future growth while minimizing maintenance time and cable stress. In summary, calculate horizontal managers based on the number of patch panels and switches, use vertical managers along rack sides, and add overhead or front-to-back units for inter-rack cabling, adjusting for cable type, density, and future expansion.
