Key Takeaways

You can modify a KVM switcher by customizing hotkeys, remapping keys, and using the administrator configuration terminal for advanced settings.

Hotkey Customization

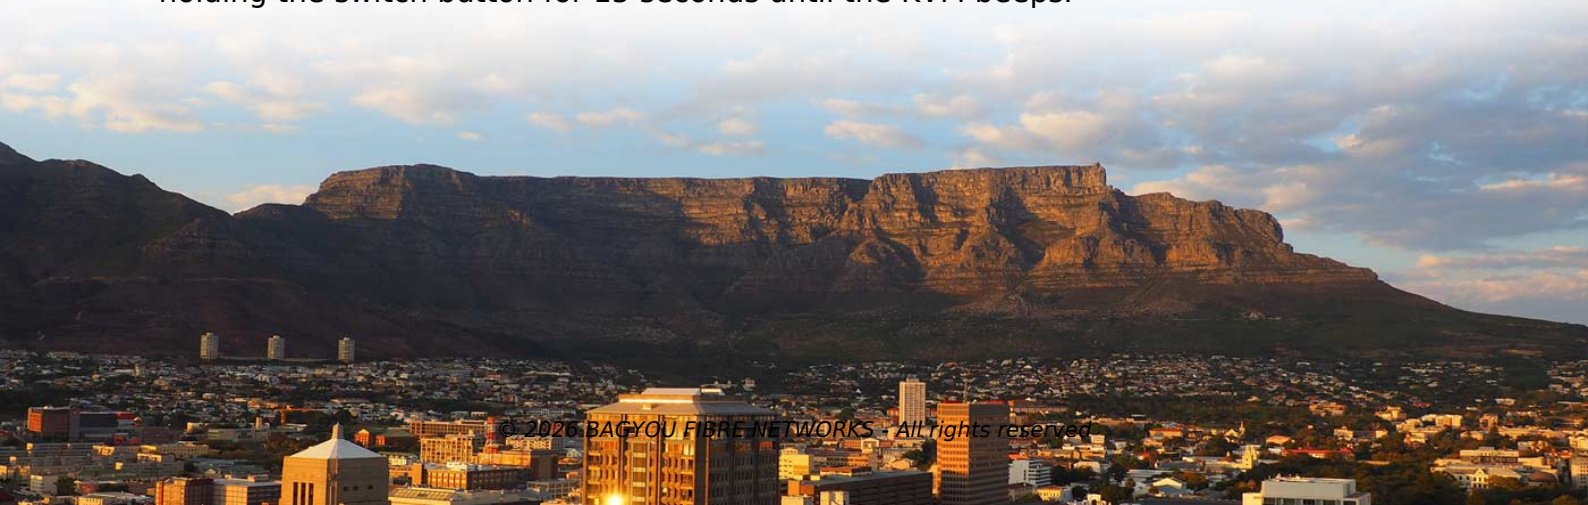

Most KV

M switches allow you to switch between connected computers using keyboard shortcuts. For example, AV Access KVM switches let you assign a hotkey such as Caps Lock or Tab to switch PCs. To change the hotkey, hold Ctrl + Alt + Shift and press [to enable or] to disable the hotkey function, then press your desired key twice quickly to assign it.

TE

Smart KV

Ms may use Scroll Lock or Right-Ctrl as triggers, and you can reset the hotkey by holding the switch button for 15 seconds until the KVM beeps.

Key Remapping

If you need specific key behavior across different operating systems, you can remap keys. On Linux, tools like xmodmap or xkb allow you to remap keys such as Scroll Lock to function as a KVM hotkey. Using xkb is recommended for persistent changes that survive KVM switching and apply system-wide, including at the login screen.

Administrator Configuration

Some KV

Ms, like Belkin NIAP Secure KVMs, provide an Administrator Configuration Terminal. This allows system administrators to customize settings, add security features, and configure advanced options for each KVM or KM device. Accessing this terminal lets you modify port assignments, enable or disable features, and apply settings for multiple users.

General Setup Tips

When modifying your KVM switcher, ensure that: Your keyboard is connected to the dedicated keyboard/mouse port for hotkey recognition. Hotkeys do not conflict with existing software shortcuts. All cables and peripherals are securely connected to avoid signal loss.

Passthrough mode is enabled if using Linux or other systems that require direct keyboard input. By combining hotkey customization, key remapping, and administrator-level configuration, you can tailor your KVM switcher to your workflow, improve efficiency, and maintain compatibility across multiple computers.
