

How to quickly install overhead optical cables

Overview

The objective of this document is to be an optical fibre cable installation and laying guide, addressed to new installers, also being useful as a reminder to experienced installers.

Key Takeaways

Overhead optical cables can be installed faster by using self-supporting or messenger-supported cables, leveraging existing pole infrastructure, pre-planning routes, and employing proper equipment and trained personnel.

Choose the Right Cable Type

Selecting All-

Dielectric Self-Supporting (ADSS) or messenger-supported cables allows for faster deployment.

ADS

S cables can be installed near power lines without additional support, enabling pole sharing and reducing installation time, while messenger-supported cables use a steel strand for support, simplifying hanging and tensioning.

Leverage Existing Infrastructure

Using existing utility poles or aerial structures avoids trenching and reduces groundwork. This is particularly effective in rural or suburban areas where excavation is impractical. Pre-checking pole readiness and obtaining necessary permits in advance ensures no delays during installation.

Optimize Route Planning

Survey the route thoroughly, noting pole spacing, terrain, and splice locations. Urban areas typically require 25–40m spacing, while suburban or rural areas allow 40–50m, with a maximum of 67m in extreme environments. Proper planning minimizes adjustments during installation.

Use Efficient Installation Techniques Pre-assemble cable sections and use bucket trucks or aerial lifts to reduce manual climbing time. Lash lightweight fiber to existing cables where permitted, which can significantly speed up deployment. Maintain proper tension and bend radius to prevent microbending and signal loss.

Ensure Safety and Training

Proper training and personal protective equipment for personnel is essential. Workers should maintain 3-point contact on ladders or bucket lifts, wear hard hats, gloves, and steel-toed boots, and follow safety protocols to prevent accidents that could delay the project.

Pre-

Stage Materials and Equipment Store slack cable, splice enclosures, and tools near installation points. Pre-staging reduces downtime between spans and allows crews to work continuously without returning to a central depot.

Summary

To expedite overhead optical cable installation, combine appropriate cable selection, use of existing poles, careful route planning, efficient deployment techniques, and trained personnel. These strategies can reduce installation time by 2–3 times compared to buried methods while maintaining network reliability and safety.
