How to tell if a switch port is fiber optic or Ethernet cable

Overview

A: An RJ45 port is a standard Ethernet port that uses copper cables, while an SFP port is a modular interface that allows for different types of lines, including fiber optic cables. We have some server connections which are being checked for moving to a different location. The switch (most of them 6500, 4500 and 4900) shows the ports for these servers as one gig connections. If it has a clear or colored plastic connector, it is likely fiber. Look at the cable: If the cable connected to the port is thin and. The optical port is what we usually call an optical board expansion slot that can be inserted into an optical fiber for long-distance data transmission; the Ethernet port is what we often call RJ45 port, that is, the network cable port. These ports can differ significantly in function, speed, and compatibility, which is why understanding their.
