Internal circuitry of the optocoupler

Overview

Optocouplers can be categorized based on their internal components, which define how they handle the output signal and what type of applications they are best suited for.

Key Takeaways

An optocoupler consists of an LED emitter and a photodetector, optically coupled within a light-proof package to transfer signals while maintaining electrical isolation. Core ComponentsLED (Light-Emitting Diode): The input side of an optocoupler contains an infrared LED, typically made from gallium arsenide, which converts the electrical input signal into light. When forward-biased, the LED emits infrared radiation in the 900–940 nm wavelength range.

Photodetector: The output side contains a photosensitive element such as a phototransistor, photodiode, or photo-SCR. The photodetector is sensitive to the LED's emitted wavelength and converts the received light back into an electrical signal. In phototransistor optocouplers, the transistor conducts when illuminated, allowing current to flow between its collector and emitter.

Physical Layout

The LE

D and photodetector are mounted on adjacent arms of a lead-frame, which is a conductive metal structure that supports the components and provides electrical connections to the external pins. The devices are encapsulated in an opaque or transparent epoxy package that prevents external light interference while allowing the LED's light to reach the photodetector. Some designs, like the WL-OCPT series, use a co-planar or side-by-side structure with a clear epoxy dome acting as the optical medium between the LED and phototransistor, ensuring efficient light transfer and mechanical stability.

Operation

When a voltage is applied to the LED, it emits light that travels through the optical medium and strikes the photodetector. The photodetector responds by conducting current proportional to the light intensity, effectively transferring the input signal to the output side without any direct electrical connection. This optical coupling provides high electrical isolation, allowing low-voltage circuits to safely control high-voltage circuits.

Optocouplers can operate as switches, where the phototransistor turns on and off with the LED, or in linear applications, where the output current varies continuously with the input signal. The device's performance is influenced by parameters such as the current transfer ratio (CTR), parasitic capacitance, and response time.

Summary

In essence, the internal circuitry of an optocoupler is a compact, optically coupled system consisting of an LED and a photodetector mounted on a lead-frame and encapsulated in a protective package. This design allows safe signal transfer across electrically isolated circuits, making optocouplers essential in applications like isolated power supplies, microcontroller interfaces, and noise-sensitive analog circuits.

Article Content

ANO007 | Understanding Phototransistor Optocouplers

In order to design a functionally robust and reliable application with optocouplers, it is essential to understand not only the device''s main parameters and parasitic elements, but also their tolerances

Optocoupler Tutorial and Optocoupler Application

The basic design of an optocoupler consists of a light source, usually an LED (Light-Emitting Diode), driven by the input signal which could be a digital

Optocoupler Tutorial for Beginners

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

Optocouplers can be categorized based on their internal components, which define how they handle the output signal and what type of applications they are best suited for.

Using Opto Couplers

The main purpose of an optocoupler interface is to completely isolate the input circuit from the output circuit, which normally means there will be two completely

Optocouplers Guide: Understanding Types,

An optocoupler consists of two main parts: a light-emitting diode (LED) and a light-sensitive receiver, such as a phototransistor. These components are

Optocoupler Circuit Design and Detailed Analysis

Optocoupler circuit design is not that difficult as some thought. Once you know what a CTR is and learn how to use it, then Optocoupler circuit design is that easy.

Opto-Isolated Input Circuits | Tutorials on Electronics | Next Electronics

Diagram Description: The diagram would physically show the internal structure of an optocoupler with its LED and phototransistor components, their isolation barrier, and input/output connections.

Everything You Need to Know About Optocouplers in

For our demo purposes, we will be using the PC817, a commonly used transistor output optocoupler in electronics. Starting with a brief explanation

Opto Coupled Devices

Designing Optocoupler Interfaces The main purpose of an optocoupler interface is to completely isolate the input circuit from the output circuit, which normally means there will be two completely separate

Optocoupler: Its Types and Various Application in

Optocoupler also called Opto-isolator, photo coupler or optical isolator. Often in circuits, especially low voltage or highly noise sensitive circuits,

What Is Optocoupler and Its Application with Examples

They contain an optocoupler plus the high-power switching components and protection circuitry inside a single, larger block. They can switch

How Optocouplers Work

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

FREE COURSE!! Learn about optocouplers. We''ll look at how they are used to control circuits, how they work and also how to design some simple optocoupler circuits to show the working

Internal circuit diagram of an optocoupler.

Download scientific diagram | Internal circuit diagram of an optocoupler. from publication: Development of an Image Processing Based Container Traffic Control System | This paper presents the ...

Optocouplers & Optoisolators | Optoisolator Circuits & Optocouplers ...

While they''re similar to photo-TRIACs, photo-SCRs only allow current flow in one direction. · Logic output: These contain additional internal circuitry (like Schmitt triggers or amplifiers) to provide clean,

What is Photocoupler | Optocoupler | Optoisolator

What is an Optocoupler (Optoisolator / Photocoupler)? An Optocoupler (Optoisolator / Photocoupler) is an electronic component that transfers electrical signals between two isolated

What is an Optocoupler, Optoisolator, Photocoupler

Optocouplers can be described by a variety of different names including optoisolator, and photocoupler. Essentially an optocoupler or photocoupler is a semiconductor device that uses a short optical path

Optocoupler Tutorial and Optocoupler Application

Optocoupler Tutorial Optocouplers, also known as opto-isolators, uses infrared light to transfer electrical signals between two electrically isolated circuits and are commonly classified by

Optocoupler Construction, Working, and important Parameters

Figure 7.26 – optocoupler with LED and phototransistor Important Parameters for an Optocoupler Important parameters of an Optocoupler are as follows: Isolation Voltage The maximum
