Is a 380 distribution box considered high voltage

Overview

380V high voltage or low voltage Summary : 380V is considered low voltage in the power system, but due to its high power and high risk, it should be treate.

Key Takeaways

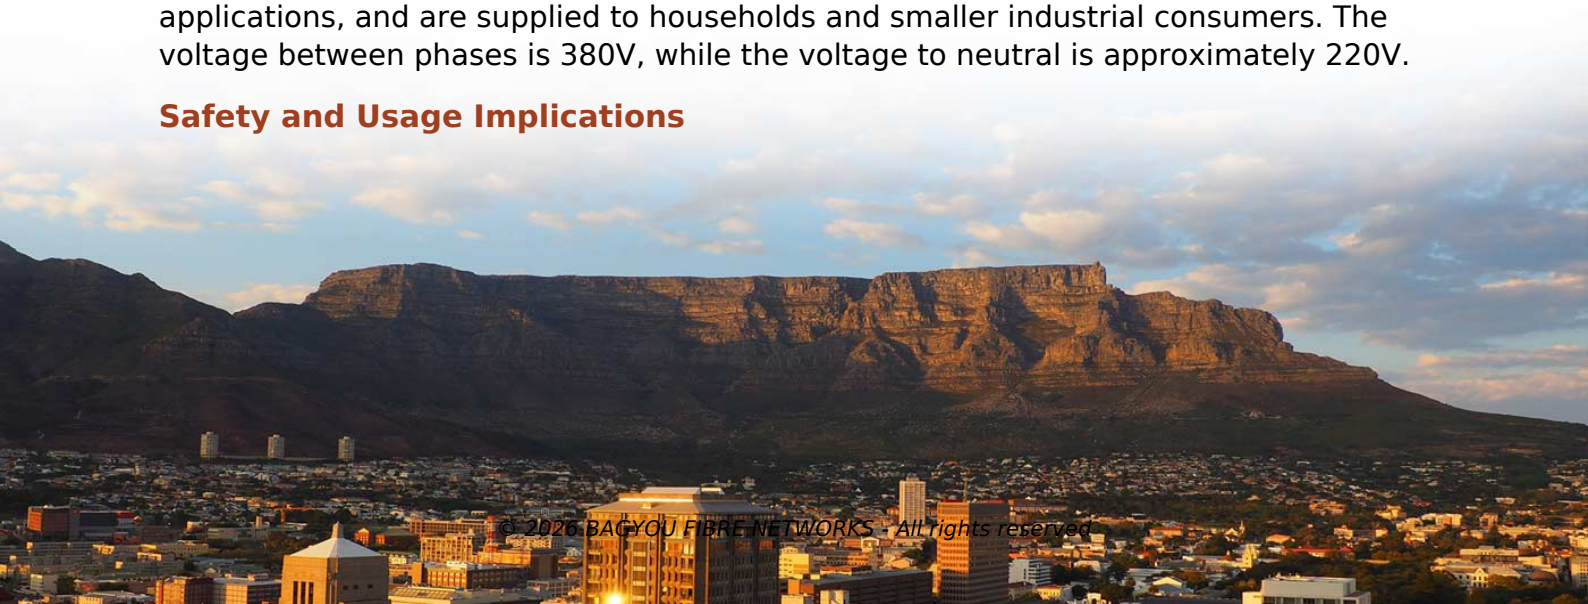

No, a 380V distribution box is classified as low voltage, not high voltage.

Voltage Classification

According to international standards (IEC 60038), low voltage systems include AC voltages up to 1,000 V, which covers typical three-phase systems such as 380V, 400V, or 415V used in Europe. High voltage systems start at voltages above 1 kV, with medium voltage ranging from 1 kV to 35 kV and high voltage above 35 kV. Therefore, a 380V distribution box falls well within the low voltage category.

Context of 380V SystemsThe 380V AC three-phase system was historically used in mainland Western Europe and has been harmonized to a nominal 400V AC standard. These voltages are intended for residential, commercial, and light industrial applications, and are supplied to households and smaller industrial consumers. The voltage between phases is 380V, while the voltage to neutral is approximately 220V.

Even though 380V is considered low voltage, it is still dangerous and capable of causing serious injury or death if mishandled. Proper insulation, protective devices, and adherence to electrical codes are essential when working with distribution boxes at this voltage level. In summary, a 380V distribution box is low voltage, commonly used in three-phase systems for homes and small industries, and is not classified as high voltage.
