Methods for removing trunk optical cables

Overview

Cable Removal: Best Practices This comprehensive guide will delve into the best practices for cable removal, the benefits of maintaining a clean cable envi.

Key Takeaways

Trunk optical cables should be removed carefully by disconnecting connectors, releasing tension, and handling the fibers to avoid bending, crushing, or damage.

Safety Precautions

Before removing trunk optical cables, ensure all power sources are turned off if possible, and wear protective gear such as gloves and safety glasses to prevent injury and protect the fibers from contamination or damage. Fiber-optic cables can emit laser light that may harm your eyes, so never look directly into the ends of the cables or transceivers during removal (Juniper documentation).

Disconnecting Connectors

Identify the cable to be removed to avoid disconnecting the wrong trunk. Remove protective caps from connectors carefully. Unlock or release the connector mechanism (e.g., ejector lever or pull tab for QSFP or SFP transceivers) and gently pull the connector straight out without twisting or bending the fiber.

Label cables if necessary to ensure correct reconnection later.

Releasing Tension

Trunk cables are often routed through conduits or cable management systems under tension. Release any tension before attempting to pull the cable out to prevent stretching or damaging the fibers. Use a pulling grip if the cable is long or heavy, ensuring the grip is attached to the strength members of the cable, not the fibers themselves.

Handling the Cable

Maintain the minimum bend radius specified by the manufacturer to avoid kinking or crushing the cable. Avoid sharp bends, excessive pulling force, or twisting. Coil any excess cable neatly in the cable management system to prevent stress points.

For trunk cables with pre-terminated connectors, do not cut or disassemble the connectors; handle them according to the manufacturer's instructions. Post-RemovalCover disconnected connectors with rubber safety caps to protect the fiber ends. Inspect the cable for any damage before storing or reinstalling.

If the cable was under stress during removal, consider trimming a few meters from the ends to remove any sections that may have been compromised. By following these steps, trunk optical cables can be safely removed without compromising the integrity of the fibers or connected equipment, ensuring reliable performance when reinstalled or replaced.

Sheath Removal of FREEDM“ Loose Tube Ribbon Fiber Optic Cables

Note:During cable sheath removal, the central member length is intentionally cut long for ease of installation into various types of hardware. The central member should be trimmed after installation

Pulling Fiber Optic Cable

Fiber optic cable is surprisingly strong, durable and pliable; however, several best practices should be followed to ensure a successful cable

Pulling and Installation of EDGETM Solutions Trunk

Pic.1 Stretch foil Pic.2 Remove from the inside of the reel trunk holder kit, accessories and documentation.

A Beginner''s Guide to Terminating Fiber Optic Cables

However, if you''re new to the world of fiber optics, you might wonder what it means to terminate fiber optic cables and why it''s important. In this guide, we''ll break down the process step by step,

How to Strip and Prepare Fibre Optic Cable for Termination: A ...

In this informative guide, we''ll walk you through the step-by-step process of stripping and preparing fibre optic cable for termination, covering techniques, tools, and best practices to help you

The FOA Reference For Fiber Optics

The proper method of pulling fiber optic cables is always to attach the pull rope, wire or tape to the strength members. Some cables also include a central fiberglass
