Mutual inductance type distribution box

Overview

The Mutual Inductor block lets you model a mutual inductor (two-winding transformer) with nominal inductance tolerances for each winding.

Key Takeaways

A mutual inductance type distribution box is a specialized electrical enclosure that integrates mutual inductance-based metering or measurement with power distribution, commonly used in three-phase systems.

Overview

A mutual inductance type distribution box combines the principles of mutual inductance with a distribution enclosure. Mutual inductance occurs when a changing current in one conductor induces a voltage in another nearby conductor through a shared magnetic field, enabling energy measurement or signal coupling between circuits. This principle is central to transformer-based metering, where the primary current induces a proportional voltage in a secondary coil for accurate measurement.

ApplicationsThree-phase electricity metering: These boxes often house meters that use mutual inductance to measure current and voltage in three-phase systems, providing accurate billing and monitoring. Power distribution: They serve as a hub for distributing electricity to multiple circuits while integrating measurement devices. Industrial and commercial installations: Suitable for environments requiring robust, modular, and decentralized distribution solutions, including smart buildings and automated systems.

Features

Enclosure: Typically designed to meet IP protection standards (e.g., IP67) for dust and moisture resistance. Modular design: Allows flexible installation of meters, switches, and protective devices. Pluggable connections: Simplifies wiring and maintenance, often using insulation displacement or push-in contacts for secure connections.

Three-phase compatibility: Supports three-phase systems with mutual inductance meters for accurate energy measurement.

Advantages

Accurate measurement: Mutual inductance meters provide precise readings even under varying load conditions. Safety and reliability: Enclosures protect internal components and allow safe operation in harsh environments. Decentralized installation: Facilitates modular and scalable power distribution, reducing installation time and complexity.

Example Product

The KG-FKS1C01A is a three-phase mutual inductance type electricity meter box manufactured by Zhejiang Kangge Electric Co., designed for industrial and commercial applications. It supports flexible shipping options and various payment methods for procurement. In summary, a mutual inductance type distribution box integrates energy measurement using mutual inductance with robust power distribution, making it ideal for three-phase systems in industrial, commercial, and smart building applications.
