Optical Module Instruments

Overview

Download one or both search tools listed below to quickly browse our third-party providers or find a specific optical module to meet your needs.

Key Takeaways

Optical modules can be used in a variety of instruments, including photonic test systems, microplate readers, and optical communication analyzers, to enable flexible, high-precision measurements and customized assays.

Photonic and Optical Test Instruments

Instruments such as Keysight photonic component analyzers and coherent transmission testers accept optical modules for testing and characterizing optical components and systems. These analyzers support complex measurements of optical signals, including error vector magnitude, Q-factor, and phase error, and can accommodate modular options for different bandwidths and channel configurations. Similarly, Yokogawa's Multi Application Test System (MATS) allows hot-swappable optical modules for high-precision testing of transceivers, photonic components, and silicon photonics devices, often paired with optical spectrum analyzers (OSAs), wavelength meters (WLMs), and high-speed oscilloscopes.

Luna's suite of optical component testers also supports active and passive fiber optic modules for interferometric systems, polarization management, and optical coherence tomography (OCT) applications. Microplate ReadersHigh-throughput screening instruments like the PHERAstar FSX microplate reader use interchangeable optic modules to optimize detection for fluorescence- and luminescence-based assays. Each module contains all necessary components—filters, dichroic mirrors, beam splitters, and polarizers—tailored for a specific assay.

Modules are easily inserted into the instrument's bays, allowing rapid configuration changes and barcode-based identification for automated assay selection.

Optical Communication and Data Modules

Optical communication instruments, including SFP, SFP+, XFP, CFP, and X2/XENPAK transceivers, rely on modular optical designs for high-bandwidth data transmission. These modules integrate laser diodes, photodiodes, and precise control electronics, and can be inserted into compatible test systems or network equipment for performance validation, signal monitoring, and system optimization.

Summary

Instruments that accept optical modules provide flexibility, precision, and scalability across multiple applications: Photonic test systems: Keysight, Yokogawa, Luna for R&D, manufacturing, and system validation. Microplate readers: BMG LABTECH for high-throughput biochemical assays. Optical communication testers: SFP/XFP/CFP modules for high-speed data networks.

These modular systems allow users to customize measurements, switch between assays or tests quickly, and maintain high accuracy across diverse optical applications.
