Optical module is going up and down simultaneously

Overview

Optical Link Failure Troubleshooting: Switch-to-Switch (SMF/MMF) Network link down?

Learn how to troubleshoot optical link failures between network switche.

Key Takeaways

Frequent up-and-down behavior of an optical module usually indicates issues with the module, fiber connection, port configuration, or environmental factors.

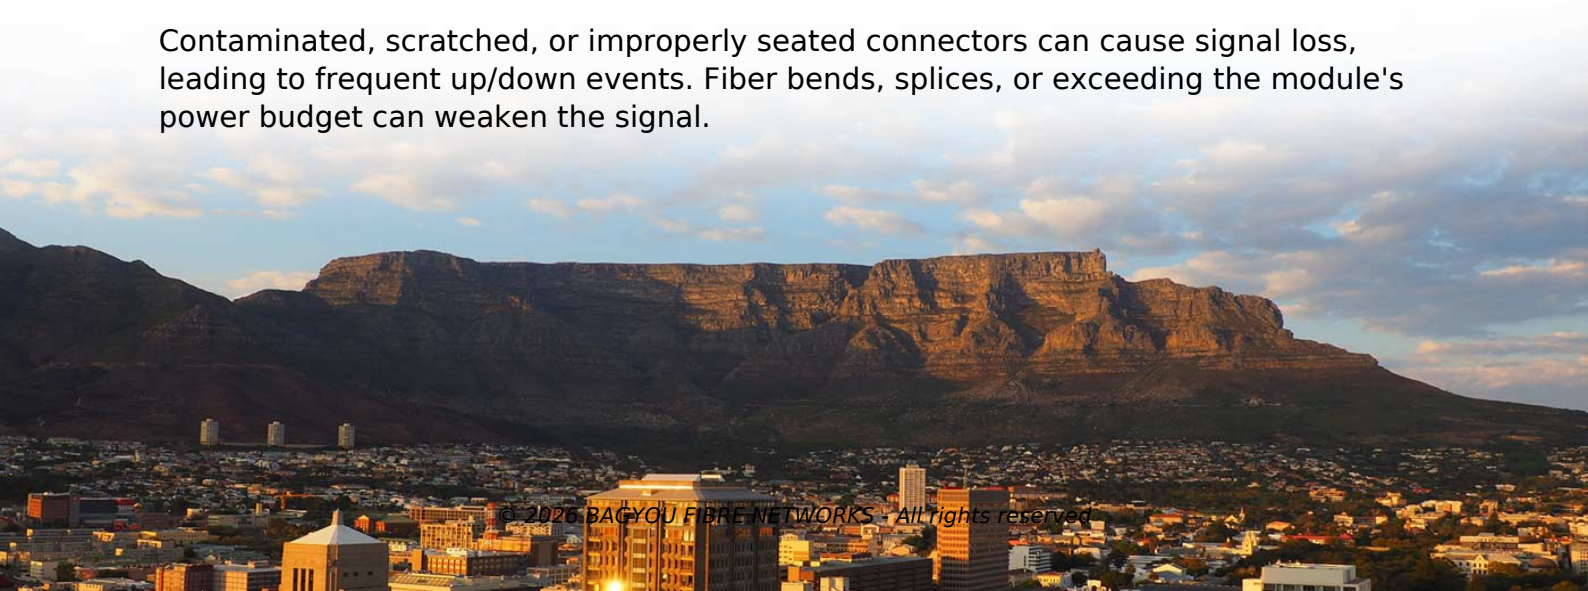

Common Causes

Optical Module Faults

The module itself may be defective, especially if the transmit or receive optical power is outside the normal range. Modules with digital diagnostic monitoring (DDM) can help identify critical power levels. Non-certified or third-party modules may be incompatible with the switch, causing intermittent link status.

Fiber and Connector Issues

Contaminated, scratched, or improperly seated connectors can cause signal loss, leading to frequent up/down events. Fiber bends, splices, or exceeding the module's power budget can weaken the signal.

Port Configuration Mismatch

Mismatched speed, duplex, or auto-negotiation settings between the optical module and the connected device can trigger link flapping. Ensure both ends of the link are configured consistently.

Environmental Factors

Overheating due to poor ventilation or high ambient temperature can cause the module to temporarily shut down. Electrostatic discharge (ESD) or power fluctuations may also affect module stability.

Troubleshooting Steps

Check Optical Power and DDMUse an optical power meter to measure transmit and receive power. Replace the module if readings are outside the specification.

Inspect and Clean Fiber Connections

Clean optical bores with a cotton swab and use dust caps on idle ports. Swap fiber jumpers to rule out faulty cables.

Verify Port Configuration

Confirm speed, duplex, and auto-negotiation settings match on both ends using commands like show interface brief or vendor-specific equivalents. Test with a Known Good ModuleReplace the optical module with a certified, working module to determine if the original module is faulty.

Check Environmental Conditions

Ensure proper ventilation and temperature control. Avoid stacking modules too densely.

Contact Technical Support

If the issue persists after checking the module, fiber, and configuration, contact the supplier or manufacturer for advanced diagnostics.

Key Takeaway

Frequent up-and-down behavior is usually not caused by a single factor. A systematic approach—checking the module, fiber, port settings, and environment—can help identify the root cause and restore stable optical connectivity.
