Optical module transmits audio signals

Overview

Optical cables, also known as fiber-optic cables, are a key component in modern audio transmission technology. These cables are designed to transmit audio signals using pulses of light instead of electrical currents. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. In an optical audio setup, the digital electrical signal from the source -- say, a DVD player -- is converted into light by a device called a transmission module. TOSLINK cables use fiber optic technology to transmit digital audio signals, which makes them distinct from other types of audio cables that use electrical. Optical cables for audio, also known as TOSLINK or fiber optic cables, transmit digital audio signals using light pulses.
