PoE switch cannot supply power

Overview

How to solve the problem of Devices not powering on via PoE?

Explanation: A software issue or temporary power surge may have caused the switch to stop suppl.

Key Takeaways

A PoE switch may fail to provide power due to port configuration, insufficient power budget, cable issues, or device incompatibility.

Common Causes

Port Configuration or Status PoE may be disabled on the switch port, or the port could be administratively shut down or error-disabled. Some switches require explicit commands like power inline auto to enable PoE on a port.

Insufficient Po

E Budget Each switch has a total power budget. If multiple devices draw more power than the switch can supply, some ports may not deliver power. Check the total and remaining PoE budget using commands like show power inline.

Device Compatibility and Po

E Standards Ensure the powered device (PD) and switch (PSE) conform to the same PoE standard (IEEE 802. 3af, 802. 3at, or 802.

3bt). Mismatched modes (Alternative A vs. B) can prevent power delivery.

Cabling Issues Poor-quality cables, incorrect pinouts, or cable runs exceeding 100 meters can prevent PoE delivery. Use Cat5e or higher, and for higher power devices, Cat6 or Cat6a is recommended. Hardware Faults A defective PoE power supply or a faulty PoE section in the switch can cause multiple ports to fail.

If non-PoE devices still work, the issue may be isolated to the PoE circuitry.

Step-by-

Step Troubleshooting

Verify Port Status Use commands like show interface status to ensure ports are not shut down or error-disabled. Re-enable ports with no shutdown if necessary. Test with a Known Good Device Connect a powered device directly to the switch using a short, verified patch cable.

If it powers on, the issue may be with the original cable or device.

Check Po

E Budget and Settings Confirm the switch has enough power for all connected devices. Adjust settings or redistribute devices if the budget is exceeded. Inspect Cables and Distance Replace cables with certified Cat5e or higher.

Ensure cable runs do not exceed 100 meters. For longer distances, consider PoE extenders.

Review Device Compatibility Confirm the P

D supports the PoE standard and mode provided by the switch. Some devices may require a PoE injector if the switch cannot supply compatible power. Check for Hardware Issues If multiple consecutive ports fail, the PoE section may be defective.

Consider replacing the power supply or the switch if field-replaceable.

Preventive Tips

Always plan for 20–30% headroom in PoE budget. Use high-quality cables and maintain proper cable management. Regularly update switch firmware to ensure PoE negotiation works correctly.

Label ports and document device connections to avoid misconfiguration. By systematically checking port configuration, power budget, cabling, device compatibility, and hardware, most PoE issues can be resolved efficiently.
