Secondary distributor in the distribution box

Overview

The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. It helps organize, protect, and control electrical connections in residential, commercial, and industrial electrical systems. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. They also include metering systems, ensuring. Electric power distribution is the final stage in the delivery of electricity. Electricity is carried from the transmission system to individual consumers. Electrical power distribution system includes various components and processes that ensure a reliable and efficient supply of electrical. Primary distribution refers to high-voltage systems that transport power over long distances, while secondary distribution involves low-voltage systems delivering power directly to homes and businesses.
