Selection of switches for primary distribution boxes

Overview

Distribution Box and Selection Guide: Internal Structure, Components. Below is a simplified internal structure diagram for a typical single-phase AC dist.

Key Takeaways

Primary distribution boxes use a variety of switches including main switches, isolators, circuit breakers, and transfer switches to control, protect, and isolate electrical circuits.

Main Switches

The main switch or main breaker controls the entire electrical supply to the distribution box. It allows complete disconnection of power during maintenance or emergencies and is rated for the maximum current capacity of the service.

Circuit Breakers

Circuit breakers are automatic switches that protect individual circuits from overcurrent or short circuits. They trip to interrupt power flow when a fault occurs and can be reset manually after resolving the issue. Types include: Miniature Circuit Breakers (MCBs) for low-current circuitsMolded Case Circuit Breakers (MCCBs) for higher current applicationsIsolatorsIsolators are manually operated switches used to disconnect a part of the circuit for maintenance.

They ensure safety by preventing accidental energization while work is being performed.

Transfer Switches

Transfer switches are used in systems with multiple power sources. They can be: Manual Transfer Switches, operated manually to switch between primary and backup powerAutomatic Transfer Switches (ATS), which automatically switch to an alternate power source when the primary supply fails.

Tie and Sectionalizing Switches

In primary distribution networks, tie switches connect two feeders at normally open points to improve reliability. Sectionalizing switches isolate faulted sections while maintaining service to unaffected areas.

Network Protectors

For high-reliability systems like spot networks, network protectors prevent reverse power flow through transformers and allow multiple failures without affecting customers.

Summary

Primary distribution boxes integrate these switches to ensure safe, reliable, and flexible power distribution. The combination of main switches, circuit breakers, isolators, transfer switches, tie switches, and network protectors allows operators to control power flow, isolate faults, and maintain service continuity in both residential and industrial settings.
