Serial Communication Implementation via Optical Module

Overview

Goal of this project is to implement a simple serial communication system using optical link and UART. Transmitted data are organized in packets of fixed but arbitrary length. For both communication nodes the two Arduino Minis and for transport. In order to effectively extend the data transmission distance and solve the problems of electromagnetic radiation, electromagnetic interference prevention, non-common ground between point-to-point devices, lightning strike resistance and channel resource sharing when transmitting data through. Used for communication between the Arduino board and a computer or other devices. All Arduino boards have at least one serial port (also known as a UART or USART), and some have several. The Nano ESP32 board is an exception due to being based on the ESP32 core.
