Key Takeaways

A Temporary Dual Power Distribution Box is a portable unit that safely distributes electrical power from multiple sources to various outlets, ideal for construction sites, events, or emergency setups.

Overview

Temporary dual power distribution boxes, also known as spider boxes, are designed to provide reliable, portable power in locations without permanent electrical infrastructure. They typically feature multiple outlets and dual inlets, allowing connection to two separate power sources, such as generators or utility feeds, which enhances flexibility and redundancy. These boxes are engineered for rugged environments, often with waterproof and impact-resistant enclosures, making them suitable for both indoor and outdoor use.

Key Features

Dual Inlets: Common configurations include L14-30P and SS2-50P, or similar twist-lock connectors, enabling connection to different power sources. Voltage and Amperage: Many units operate at 125/250V with amperage ratings from 30A to 60A, depending on the model. Multiple Outlets: Boxes often include a combination of GFCI 20A receptacles, locking outlets, and specialized connectors like L6-30R or TT-30R to accommodate various equipment.
