The switch s gigabit optical port cannot be recognized

Overview

What it means: The module carries an authentication or signature byte that the switch checks; when the check fails the switch refuses to enable the port. This is a deliberate vendor control to prevent third-party optics. What to do: Use vendor-approved optics where. The table describes the LED status indicators for Ethernet modules or fixed-configuration switches: Ensure that both sides have a link. A single broken wire or one shutdown port can cause the problem where one side has a link light, but the other side does not. There are no specific requirements for this document. Hardware failures: include hardware. A switch is connected to a remote device through optical interfaces and optical fibers. Many major brands, including Cisco, HP, and Juniper, use strict module authentication.
