The wall-mounted distribution box should be at least distance from the edge of the wall

Overview

The National Electrical Code provision 110. 26 clarifies that electrical boxes must be supplied with at least 3 feet of free space surrounding them for safety measures. The depth of working space, which you measure from the enclosure front (not the live parts), cannot be less than the distances in Table 110. These distances are determined by voltage-to-ground and three different conditions: Condition 1. The table requires you to know two. The code governs where you can place a box, how many wires it can hold, how it must be supported, and how connections inside it must be made. Getting any of these wrong creates real inspection failures and, more importantly, real fire and shock hazards. Junction boxes must remain accessible after. Choose the right box based on environment (indoor/outdoor), load capacity, and durability. Check for proper IP/NEMA ratings and material quality. Practice good wiring: secure. Wireway Depth: The maximum permitted distance for the through (wireway) beyond the front of panelboard is 6 inches, the trough's depth is 12 inches and switchboard's depth is 24 inches.
