WDM Wavelength Division Multiplexing Simulator

Overview

GitHub - Preetansh24/WDM-Simulator-: A high-performance Python-based Wavelength Division Multiplexing (WDM) simulator for optical networks. Model fiber attenuation, amplifier gain, crosstalk, and non-linear effects. In a nutshell, WDM-Sim is a python-based simulator for multi-microring wavelength arbitration/allocation at the Dense-Wavelength-Division-Multiplexing (DWDM) system. Wavelength division multiplexing is a method of modulating multiple signals at different wavelengths (channels) to transmit them on a single waveguide or fiber. To begin with, we assume that we have the element. 40 WDM channels spaced at 100 GHz, each carrying 100 Gbps, deliver a total fiber capacity of 4 Tbps with a spectral efficiency of 1. 0 bit/s/Hz — a standard DWDM configuration.
