What are fiber optic cables made of

Overview

There are hybrid optical and electrical cables that are used in wireless outdoor Fiber To The Antenna (FTTA) applications. In these cables, the optical fibers carry information, and the electrical conductors are used to transmit power. These cables can be placed in several environments to serve antennas mounted on poles, towers, and other structures.

Key Takeaways

Fiber optic cables are primarily made of ultra-pure silica glass or plastic for the core, surrounded by cladding, protective coatings, strength members, and an outer jacket.

Core and Cladding

The core is the central part of the fiber through which light travels. It is typically made from ultra-pure silica glass for long-distance, high-speed transmission, or from plastic polymers like PMMA for short-distance applications. The cladding surrounds the core and has a slightly lower refractive index, which ensures total internal reflection, keeping light confined within the core.

Cladding is usually made from fluoride-doped silica or similar materials.

Protective Coatings

To protect the delicate core and cladding, fibers are coated with UV-cured acrylate layers, often in a dual-layer system: a soft primary coating and a hard secondary coating. These coatings prevent micro-scratches, moisture ingress, and mechanical damage during handling and installation.

Strength Members

Fiber optic cables include strength members to provide tensile strength and durability. Common materials include aramid yarn (e.g., Kevlar®), fiberglass rods, or steel wires, depending on the cable type and application. These materials protect the fiber from stretching or breaking during installation and environmental stress.

Outer Jacket

The outer jacket shields the cable from environmental hazards such as moisture, chemicals, and physical impact. Typical jacket materials include PVC, polyethylene (PE), or low-smoke zero-halogen (LSZH) compounds. For outdoor or submarine cables, additional layers like water-blocking gels, metallic armoring, or specialized chemical repellents may be added.

Additional Components

Some fiber optic cables include ribbon matrices, identification inks, or micro-additives to improve performance, facilitate installation, or prevent crosstalk. In specialized applications, metallic components may be incorporated for grounding or chemical insulation. Glass vs.

Plastic Fibers

Glass fibers: Made from ultra-pure silica, they offer low signal loss, high durability, and are suitable for long-distance transmission, but are more fragile and expensive. Plastic fibers: Made from polymers like acrylate or polyimide, they are flexible, easier to handle, and cost-effective, but have higher signal loss and are suitable for short-distance applications. In summary, fiber optic cables are complex assemblies designed for high-speed, low-loss data transmission, combining optical materials, protective coatings, structural strength members, and environmental jackets to meet diverse application requirements.

According to Telcordia GR-3173, Generic Requirements for Hybrid Optical and Electrical Cables for Us

What Materials Are Fiber Optic Cables Made Of?

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

Optical fiber consists of flexible glass or plastic strands engineered to transmit light. Manufacturers produce these fibers through a strict three-step

Basic Components of a Fiber Optic Cable – trueCABLE

What are fiber optic cables made of? A fiber optic cable consists of five basic components: the core, the cladding, the coating, the strengthening fibers, and the cable jacket.

Optical fiber

Because of these properties, silica fibers are the material of choice in many optical applications, such as communications (except for very short distances with plastic optical fiber), fiber lasers, fiber

Fiber Optic Cable Components & Materials: Complete

Explore the 5 key fiber optic cable components and materials used in modern networks. Learn how glass, coatings, and strength members affect

What Materials are Fiber Optic Cables Made Of?

Fiber optic cables are primarily made of extremely pure glass (silica), though some specialized cables utilize plastic polymers for specific applications. These materials allow for the

What Is Fiber Cable Made Of? Materials & Layers Explained

The short answer is: most fiber cables are made of glass, but plastic fiber also exists and is used in specific situations. The difference is not academic—it directly affects distance, bending

What Are Fiber Optics Made Of?

Fiber optics are primarily made of highly pure glass (silica) or plastic, designed to transmit light signals over long distances with minimal loss.This technology relies on the principle of

What Materials Are Fiber Optic Cables Made Of: The

This in-depth guide explores the diverse materials comprising fiber optic cable components, from the specialized glass at their core to the durable

Fiber Optic Cable Types Explained

Our comprehensive guide to types of fiber optic cables. Learn all about the differences between single mode and multimode cables, as well as the various fiber wavelengths and standard core sizes used

10 Best Fiber Optic Manufacturers for 2026

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

Discover the best fiber optic manufacturers globally, offering cutting-edge multimode and single mode fiber solutions. See who tops the list for quality and innovation.

What Is Fiber Optics? A Guide

Streaming a movie, making a phone call, or getting an endoscopy may seem like disparate experiences, but they share a common thread: They''re

Bird Nests of Fiber-Optic Cables Show War''s Impact on Ukraine

Woven from fiber-optic cable and grass, a small bird''s nest found near the front line of the war in Ukraine shows how the more than four-year-old conflict is reshaping the natural environment,

What are the theoretical speed limits of fiber optic, cable and DSL?

These connections utilize coaxial cables, which are made of copper, instead of fiber optic cables, which use small, flexible strands of glass or plastic. Because it''s a less efficient way to

Fiber Optic Cable Core: Understanding Its Types and Uses

1) What is a fiber optic cable Core? “The core of a fiber optic cable is the central transparent portion of the optical fiber made up of glass or plastic which actually receives the light

Single and Multimode Patch Cables

What Are Fiber Optic Cables? As the name indicates, fiber optic cables are the network cables that use the medium of light for transferring data over a long

Fiber Optics and Types

Fiber optic cables are used for long-distance and high-performance data networking. They are capable of transmitting data over longer distances and at higher bandwidths (data rates) than

Fiber Optic Cable Types: Single-Mode, Multimode, and

Discover fiber optic cable types, including single-mode (OS1, OS2) and multimode (OM1, OM2, OM3, OM4, OM5), indoor/outdoor variants, and how
