

What is the extinction ratio of a 10 Gigabit optical module

Overview

What is Extinction Ratio (ER) and Why Does It Matter This article explains what extinction ratio is, why it matters for reducing bit error rates in optical.

Key Takeaways

The typical extinction ratio (ER) for a 10 Gigabit Ethernet optical module is around 3 to 3.5 dB.

Definition and Importance

The extinction ratio quantifies the contrast between the optical power levels representing a logical "1" (on) and "0" (off) in digital optical communication. It is calculated as the ratio of the optical power in the 'on' state to the 'off' state, often expressed in decibels (dB) using the formula $ER = 10 \log_{10}(P_{on} / P_{off})$. A higher ER indicates a clearer distinction between '1's and '0's, which reduces bit error rates (BER) and improves signal integrity over fiber links.

Typical Values for 10 GbE Modules For 10 Gigabit Ethernet (10 GbE) modules, including standards like 10GBASE-SR, 10GBASE-LR, and 10GBASE-LRM: The standard-specified ER is relatively low, around 3 to 3.5 dB, which is easier to achieve compared to SONET/SDH systems that require ~10 dB. Practical measurements of individual modules may range slightly higher, for example 5.

4 to 6.2 dB, due to calibration differences and measurement equipment variability.

Maintaining E

R slightly above the standard ensures reliable performance while avoiding excessive relaxation oscillations in directly modulated lasers like VCSELs used in 10 GbE modules. Impact on System Performance Signal Quality: A sufficient ER ensures that the receiver can clearly distinguish between '1's and '0's, minimizing BER. Power Efficiency: Lower ER reduces the risk of laser-induced ringing and allows stable operation without requiring excessive optical power.

Measurement Considerations: Accurate ER measurement requires calibrated optical sampling oscilloscopes or optical power meters, as low-level power (P_{off}) is sensitive to DC offsets and AC response of the measurement device. In summary, 10 GbE optical modules are designed with an ER of 3–3.5 dB, which balances ease of implementation, signal integrity, and laser performance, while practical measurements may show slightly higher values due to calibration and module-specific characteristics.

Extinction ratio

In telecommunications, extinction ratio (r_e) is the ratio of two optical power levels of a digital signal generated by an optical source, e.g., a laser diode. The extinction ratio may be expressed as a

The Importance of Extinction Ratio (ER) in Optical Transceivers

Learn why Extinction Ratio (ER) is critical in optical transceivers. Understand how ER impacts receiver sensitivity, BER, and module performance.

Measuring Extinction Ratio of Optical Transmitters

Extinction ratio, when used to describe the performance of an optical transmitter used in digital communications, is simply the ratio of the energy (power) used to transmit a logic level "1", to the

The relationship between ER and OMA

Let's see how to improve the extinction ratio of DML first. By definition, it is to increase the relative difference between the optical powers of the laser on and off.

AFBR-703ASDZ 850nm Digital Diagnostic SFP+ Transceiver for 10Gb ...

Transmitter Extinction Ratio (ER) The transmitter extinction ratio is defined as $10 \cdot \log_{10}(PL1/PL0)$ in dB, where PL1 is the optical power in the logic-1 state and PL0 is the optical power in the logic-0 state.

Average Transmit Optical Power and Extinction Ratio

The larger the extinction ratio, the better the logical discrimination at the receive end. The smaller the extinction ratio, the greater the possibility of signal interference and increased BER.

Cisco 10GBASE SFP+ Modules Data Sheet

This interface is not specified as part of the 10 Gigabit Ethernet standard and is instead built according to Cisco specifications. The SFP-10G-ZR-I has a cold start at -40°C; the transceiver will be

What Is the Extinction Ratio in Optical Systems?

Engineers use the ER to quantify the purity and efficiency of this switching action. It provides a direct measure of how well a system suppresses unwanted signal leakage when it is
