What is the fiber loss over 1 kilometer of G654 optical fiber

Overview

Ultra-low loss (ULL) optical fibers, PureAdvance™ series compliant with G.654.E, support high-capacity long-haul terrestrial networks.

Key Takeaways

The typical fiber loss of G. 654 optical fiber is approximately 0. 19 dB per kilometer at 1550 nm.

G. 654 fiber, also known as cut-off shifted single-mode fiber, is designed for long-haul and submarine optical transmission with a pure silica core to minimize attenuation at 1550 nm. Compared to standard G.

652 fiber, which has a loss of about 0. 22 dB/km, G. 654 fiber achieves roughly 10% lower loss, making it ideal for high-capacity, long-distance links.

Modern G. 654E variants further optimize the effective area, reducing nonlinear effects and improving signal-to-noise ratio over long spans. For practical calculations, the fiber loss over 1 km can be directly taken as the attenuation coefficient: 0.

19 dB/km, meaning that for every kilometer of G. 654 fiber, the optical signal power decreases by approximately 0. 19 dB under standard operating conditions at 1550 nm.

This value excludes additional losses from connectors, splices, or bends, which should be considered separately in system design. In summary, for a 1 km span of G. 654 fiber, expect a signal attenuation of about 0.

19 dB, making it highly suitable for long-distance terrestrial and submarine optical networks.
