What is the function of branch optical cables

Overview

What Is a Branching Unit in Submarine Cable Networks?

How branching units route fibers, reconfigure power, and — with ROADM and WSS technology — enable dyna.

Key Takeaways

Branch optical cables are used to extend trunk optical lines into multiple branch lines, commonly deployed in urban networks, airports, highways, and other high-traffic communication environments.

Overview

Branch optical cables are specialized fiber-optic cables that connect directly to a branch box on a trunk optical cable, allowing a single trunk line to feed multiple branch lines simultaneously. This design improves network flexibility, reliability, and scalability compared to traditional optical cable wiring methods.

Typical Uses

Urban Communication Networks: Branch optical cables are widely used in cities to support dense communication networks, enabling rapid deployment and upgrades of fiber-optic infrastructure. Airports and Highways: These cables facilitate high-speed data transmission in areas with heavy traffic and complex network requirements, ensuring stable connectivity for operational and safety systems. Telecommunications and Internet Service Providers (ISPs): Branch optical cables are essential for Fiber-to-the-Home (FTTH) or Fiber-to-the-Premises (FTTP) deployments, allowing ISPs to efficiently distribute high-speed internet to multiple endpoints.

Media and Broadcasting: They support high-bandwidth video and audio transmission for live broadcasts and streaming services, where multiple branch lines may be needed from a central trunk. Industrial and Commercial Networks: Branch optical cables are used in large campuses, data centers, and industrial facilities to connect multiple buildings or sections from a single trunk line, simplifying network management and expansion.

Advantages

Improved Network Reliability: Each branch line operates independently, reducing interference and maintaining trunk line stability. Enhanced Flexibility: The layout and length of branch cables can be customized according to network requirements, facilitating upgrades and topology adjustments. Simplified Wiring Structure: Branch optical cables reduce the complexity of cable management, making installation and maintenance more efficient.

Conclusion

Branch optical cables are a critical component in modern fiber-optic networks, particularly where multiple endpoints need to be served from a single trunk line. Their use in urban areas, transportation hubs, telecommunications, media, and industrial networks ensures high-speed, reliable, and scalable data transmission, supporting the growing demand for digital communication and connectivity.

What Is a Branching Unit in Submarine Cable Networks?

How branching units route fibers, reconfigure power, and — with ROADM and WSS technology — enable dynamic spectrum management between landing stations. Submarine cable

Branching Node

The optical configuration of the branching unit routes optical fiber pairs from the trunk cable to a branch cable. Two branch cable fiber pairs are required to support full connectivity to both trunk stations of

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

Definition and basic structure of branch optical cable-Aixton brand

Branch optical cable is an optical cable directly led out of a branch box on the trunk optical cable, which is used to realize that one trunk optical cable leads out multiple branch lines at the same time.

Submarine branching unit

Optical fiber cable systems can be split by either: Physically separating the signal-carrying fibers so some go in one direction and some in another, which requires no additional power.

Basics of Optical Branching Devices

Non-wavelength selective optical branching devices are passive components without a wavelength multiplexer and demultiplexer. They are also called “optical splitters” or “optical couplers”.

A Guide to the Materials used in Fiber Optic Cable Manufacturing

This guide will discuss the different types of fiber materials used to make optic cables as part of the manufacturing process. What is optical fiber? Optical fiber is a type of cable for

"Multidirectional Submarine Optical Branching Unit" by N/A

Submarine optical communication systems use branching units to connect branches of a cable to a main cable trunk. Typically, optic fibers from the trunk are branched to one of two branches, while inter

Benefits of Singlemode & Multifiber Branch Cables

Branch cables, also known as trunk cables, are essential components in high-speed data transmission systems. These fiber optic cables play a crucial role in efficiently transferring data over

Large-Capacity Optical Transmission Technology Supporting Optical ...

The optical submarine cable system that connects the countries of the world via optical fibers plays an important infrastructure role in supporting international communications networks.

Common faults and how to prevent branch optical cables

Branch optical cables, also known as distribution optical cables, are used to distribute fiber optic signals from a main cable to individual devices or endpoints.
